【問題 下記の英文を読んで、設問に答えなさい】

Today, children, teens, and adults ( A ) all ages face greater challenges than ever before. Obesity has become an epidemic and a major threat ( B ) the health of nations as obese people avoid sport and physical activity ( C ) escape stigma and embarrassment.① Parents with visions of Olympic glory or professional riches for their children think that early specialization is the key to ultimate success and put their children ( D ) specialized programs far too soon. Meanwhile, the video game industry pours billions of dollars into entertainment that keeps children (and adults) more ( ② ) than ever before, while promoting virtual sports and virtual physical activity with new pseudo motion games. These problems are global and become more pressing every day.

Despite these problems, we have all seen and been awed by the transformation of a young boy or girl from awkward sport beginner to superb athlete. We instinctively know there have been coaching and training ③along the way, as well as support from caring adults and opportunities for meaningful competition. And we know, without a doubt, that there have been glorious moments of success, but also moments of crushing disappointment along the way. Some athletes' development has been haphazard, even random, creating "champions by chance," whereas others' has been planned, systematic, progressive, and developmentally appropriate.

This ( ④ ), ( ⑤ ), and ( ⑥ ) development of individual athletes is called long-term athlete development (LTAD; also often called LTPD for long-term participant development or long-term player development).
